GHG Emission Report, v1.1
1.21.4

Instructions

This template is intended for reporting greenhouse gas emissions results to ASC. The Feed Standard does not prescribe a specific standard or set of methods for generating GHG values. However, suppliers should be aware that the development of the Farm Standard requirements may necessitate the application of specific methods for feed emissions in the future.

Emissions can be reported in either or both columns using a biophysical or economic allocation approach. Emissions results must be provided according to scope (1-3) as well as by input/activity, being general feed ingredient categories and additional transport and milling emissions that aren't otherwise captured within ingredients. 'Transport and milling' emissions should be at least equal to the sum of scope 1 and scope 2 emissions. If possible, emissions should also be broken down by category (fossil, biogenic, or land use change), facilitated by certain databases and assessment methods. Any uncategorized emissions should be reported as 'Unspecified emissions' (If feed suppliers are unable to determine emissions by category, the total of all emissions can be reported as unspecified).

*This template is also expected to reflect the resolution of data that feed suppliers will need to provide to farms to satisfy feed-related emissions modeling for the Farm Standard. Feed suppliers should be ready to adjust the composition of ingredients used in calculations to reflect typical compositions of feeds relevant to each producer, whether that is on a producer-level or a general species-level (e.g. average ASC-compliant salmon feed composition), so that relevant emissions estimates are available to aquaculture producers for their own calculations. **Only enter data in blue cells.***

Table 1. Production year

Year of production (yyyy)

2025

Table 2. GHG emissions by scope

Emissions scope

GHG emissions per tonne of ASC compliant feed (kg CO₂-eq/t)

	Biophysical (mass) model	Economic model
Scope 1	5,113	5,113
Scope 2	19,831	19,831
Scope 3	2,931	2421,565
Total	2956,262	2446,509

Table 3. GHG emissions by category

Emissions category

Fossil emissions
Biogenic emissions
Land use change emissions
Unspecified emissions

	Biophysical (mass) model	Economic model
Fossil emissions	1114,033	702,625
Biogenic emissions	13,626	3,336
Land use change emissions	1828,602	1740,547
Unspecified emissions	0	
Total	2956,261	2446,508

Table 4. GHG emission by Input / Activity

Input / Activity

	Quantity (kg/t)	Biophysical (mass) model	Economic model
Soy crop inputs	436	1712,2053	1896,1617
Other crop inputs	268	162,0495	180,8888
Reduction fishery inputs	128	164,3734	160,5742
Fishery by-product inputs	64	160,0896	31,6101
Poultry / livestock inputs	67	633,814	53,5451
Other feed inputs	37	32,4847	32,4847
Transport and milling		91,2128	91,2128
Total	1000	2956,2293	2446,4774

Notes

All emissions values must be reported in units of kg CO₂-equivalent per tonne of ASC compliant feed.

Emissions totals for each section should be equivalent.

Total feed input quantity (kg/t) must equal 1000. Use 'Other feed inputs' to make up any difference from 1000 kg. 'Other feed inputs' should also include vitamins, amino acids, and other microingredients.

Transport-related emissions may be difficult to separate from ingredient production and processing emissions, depending on the data source used. Do not include any transport emissions in 'Transport and milling' that are already counted in the emissions of one of the ingredient groups.
